20093007431505AR C 0909497G	REGENTS OF THE UNIVERSITY OF COLORADO, THE	UNIVERSITY OF COLORADO AT BOULDER	803090572	150,000	5,078	On March 24, 1989, the tanker vessel Exxon Valdez ran aground on Bligh Reef, a well-marked navigational hazard in the Valdez Arm of Prince William Sound (PWS), Alaska spilling 11 million gallons of crude oil into the surrounding ecosystem. In various ways, Recent changes in the flow dynamics and overall geometry of the Greenland Ice Sheet have been concurrent with increased surface melting: the velocity of some outlet glaciers has increased, the ice sheet margins have thinned, and the overall mass of the ice sheet has decreased. The goal of most climate research is to detect change over time. Much of the data are in the form of spatially arranged remote sensing data or model output. These data sets are voluminous and tend to be organized as separate geo-referenced files for a single project. Dr. Begelman will study the formation and growth of the most massive black holes in the cosmos. These are the powerhouses for the luminous active nuclei that are found at the centers of luminous galaxies. The black holes must grow rapidly, since luminous quasars are thought to be powered by accretion onto a central black hole. The award is for a pilot program to explore two areas related to OH masers: an OH maser survey of the Andromeda galaxy (M 31) to study the dark matter distribution and kinematics in the Local Group, and an OH megamaser survey at redshift $\sim 1$ close to the present epoch. This collaborative team plans to investigate the evolution of interplanetary coronal mass ejections (ICMEs) at large distances from the Sun. They expect to identify the reasons that existing models do not accurately describe this ICME evolution. With this award, the team will investigate the El Niño-Southern Oscillation (ENSO) corresponds to a sloshing of water in the equatorial upper Pacific: during an ENSO cycle water moves back and forth north to south and east to west. This suggests that the time-mean effects of ENSO are to homogenize the climate. This project is creating a carefully validated global model that addresses how sea salt from the oceans, soil dust from major deserts, and smoke particles from natural fires enter the atmosphere, are transported and then impact the climate. The work makes a major objective of the Geospace Environment Modeling (GEM) Focus Group on Space Radiation Climatology is to investigate the relationships between interplanetary conditions and trapped radiation belt particles and how these relationships change on long time scales. This project aims to better delineate the global manifestations of non-migrating tides from the stratosphere through the thermosphere and to better determine the origin of the non-migrating tides which is largely in the troposphere. The investigation of tides in the thermosphere will be a major objective of the investigation. This collaborative investigation into the forest atmosphere photochemistry will apply a unique set of collaborative approaches, focused on the chemistry occurring in the near-canopy environment. It is now well known that forests emit biogenic volatile organic compounds (BVOCs) and these compounds play a role in atmospheric chemistry. The Investigator will develop a simple, effective, and inexpensive method of obtaining very high-vertical-resolution atmospheric measurements made in close proximity to the SOUSY radar beam in Jicamarca Peru (a NSF Upper Atmospheric Facilities funded center). Under what conditions do people become environmentalists? What causes translocal and transnational efforts to protect biodiversity to be adopted and connected with local interests? What are the implications of trends in global conservation practice toward	Investigator, Research Assistant	0.7
